

The background of the entire image is a close-up, high-angle shot of a textured, light-brown surface, possibly a piece of wood or stone. On this surface, several items are scattered: a black smartphone in the upper right, a black calculator in the upper right, and two credit cards in the lower right. The smartphone screen displays the word 'Replazement' in a bold, sans-serif font, with some smaller, less legible text below it. The credit cards are partially overlapping, showing various colors and designs.

NEXUSFIN · RESPONSIBLE CREDIT

Credit access is not the same as credit affordability

NEXUSFIN HELPS PEOPLE UNDERSTAND WHETHER A CREDIT COMMITMENT FITS THEIR FINANCES BEFORE IT BECOMES A BURDEN.

Thin files and complex offers leave people exposed

- Irregular income, informal work, existing obligations, and financial shocks can make affordability hard to judge.
- Consumers need more than a headline instalment: they need total cost, remaining buffer, and downside scenarios.
- Responsible credit must improve access without increasing over-indebtedness or hiding the reasoning.

NexusFin turns a credit offer into a financial-health picture

One view connects the offer to the person's actual financial room.

Profile

Income, essential expenses, savings, existing debt, and recurring commitments.

Assess

Repayment, total cost, remaining cash flow, and debt-service burden.

Stress test

Income reductions, expense increases, and combined shocks.

Explain

Plain-language factors, trade-offs, and safer alternatives.

One journey from “Can I borrow?” to “What happens if I do?”

Compare the credit, not just the approval

Show monthly repayment, total repayment, total borrowing cost, remaining cash flow, and stress performance side by side across multiple offers.

Option	Monthly repayment	Total cost	Stress result		
A	Higher	Lower term	Buffer narrows		
B	Lower	Higher total cost	More resilient		
C	Moderate	Smaller principal	Best starting fit		

The demo makes financial pressure visible

Illustrative scenario, not an approval decision.

- Illustrative profile: KES 60,000 income, KES 32,000 essential expenses, KES 8,000 existing debt. A sample offer produces approximately KES 5,500.80 monthly repayment and KES 67,009.59 total repayment.
- The base case can look manageable while a 25% income shock leaves a negative buffer.
- The point is not an automatic approval or rejection; it is a clearer decision before commitment.

One offer. Two realities.

ILLUSTRATIVE PROFILE · KES

AI where it helps, deterministic logic where it matters

Deterministic logic

Financial calculations come from transparent rules and validated formulas.

Every signal should be traceable, correctable, and explainable.

AI-assisted interpretation

Analytics can identify income variability, recurring obligations, and cash-flow patterns.

AI can categorize messy financial data and translate results into plain language.

Alternative data with consent, purpose, and limits

Relevant inputs

Potential inputs include bank or mobile-money cash flow, savings activity, repayment history, and small-business revenue.

Clear permission

Use only relevant data, with explicit consent, clear purpose, retention controls, and auditability.

Hard limits

Exclude surveillance-style signals and irrelevant personal data.

Complement, do not replace

For partners, NexusFin complements existing underwriting; it does not replace human or institutional decisions.

A working MVP designed for a credible pilot

- 1 Prototype capabilities:** Repayment calculations, affordability, stress testing, offer comparison, transaction analysis, consent controls, explainability, REST APIs, and testing.
- 2 Next validation:** Representative user testing with synthetic or properly consented data.
- 3 Pilot and measure:** Pilot with a financial institution or financial-health programme, then measure comprehension, comparison behavior, and decision quality.

From one responsible-credit engine to ASEAN scale

Model

B2B SaaS, B2B2C integration, and financial-health programme deployments.

Impact

Clearer repayment understanding, better comparison, stronger resilience awareness, and more responsible assessment.

Scale

Localize language, financial products, income patterns, regulatory requirements, and data integrations while keeping the core engine modular.

North star: access + affordability + understanding.
